

WHY CHOOSE

Point of Service Meal Counts

Electronic entry of meal counts can be restricted to the approved meal service times automatically with My Food Program. We can even accommodate different meal types offered at different meal times on different days of the week.

Maximize Your Reimbursement

By minimizing claim errors, you are able to maximize reimbursement. Stay up-to-date with state and national policies. My Food Program will notify you of expiring forms allowing you to ensure you are not losing reimbursement dollars.

Secure Data

My Food Program creates a full copy of all data at least once a day and stores it using Amazon Web Service (AWS). The "live" data and the copy of the data are stored in separate facilities. That means that if there is a natural disaster and one copy of the data is destroyed, we automatically have another copy. Copies of data are maintained per the USDA federal regulation for a period of 3 years and 3 months.

Reduced Errors

My Food Program can catch errors that are easily missed when processing claims by hand. Unlike paper, software can keep users from entering data in the incorrect place or entering inconsistent data (such as counting more meals served than were received). In addition, reports generated from software always have legible numbers! Our software performs edit checks and provides confidence in your compliance with regulations.

No More Missing Paperwork

When recordkeeping is done on paper, then if the paper is lost or damaged, the data is gone. With software, the data is stored in a database and always accessible. My Food Program uses cloud storage, which means you can view the same data on any internet-connected device. You do not have to be onsite to acccess your food program records.

My Food Program reduces the number of hours you spend recording data and ensuring CACFP and SFSP compliance. With our easy solution you will be able to claim reimbursements on time.
